

# Identification and Assessment of Chemical Safety Vulnerabilities

**Shivaji S. Seth**

Senior Technical Advisor for Nuclear Safety  
DOE Richland Operations Office

DOE/EFCOG Chemical Safety Workshop, Washington, D.C.  
December 15, 1999

# Generic Vulnerabilities

## 1994 DOE Chemical Vulnerability Assessment

- ◆ Inadequate Characterization
- ◆ Unanalyzed Hazards
- ◆ Past chemical Spills
- ◆ Lack of Planning
- ◆ Improper Storage
- ◆ Deteriorated Conditions
- ◆ Abandoned and Residual Chemicals
- ◆ Inadequate Inventory control

### *Management Weaknesses*

*Lack of Commitment to Chemical Safety*  
*Inadequate Management of Aging Facilities*  
*Weaknesses in Facility Transitioning*  
*Inconsistent Budget for Chemical Safety*

# Chemical Explosion in Tank A109

# Explosion Impacts

**PRF ROOM 40 AFTER EXPLOSION**

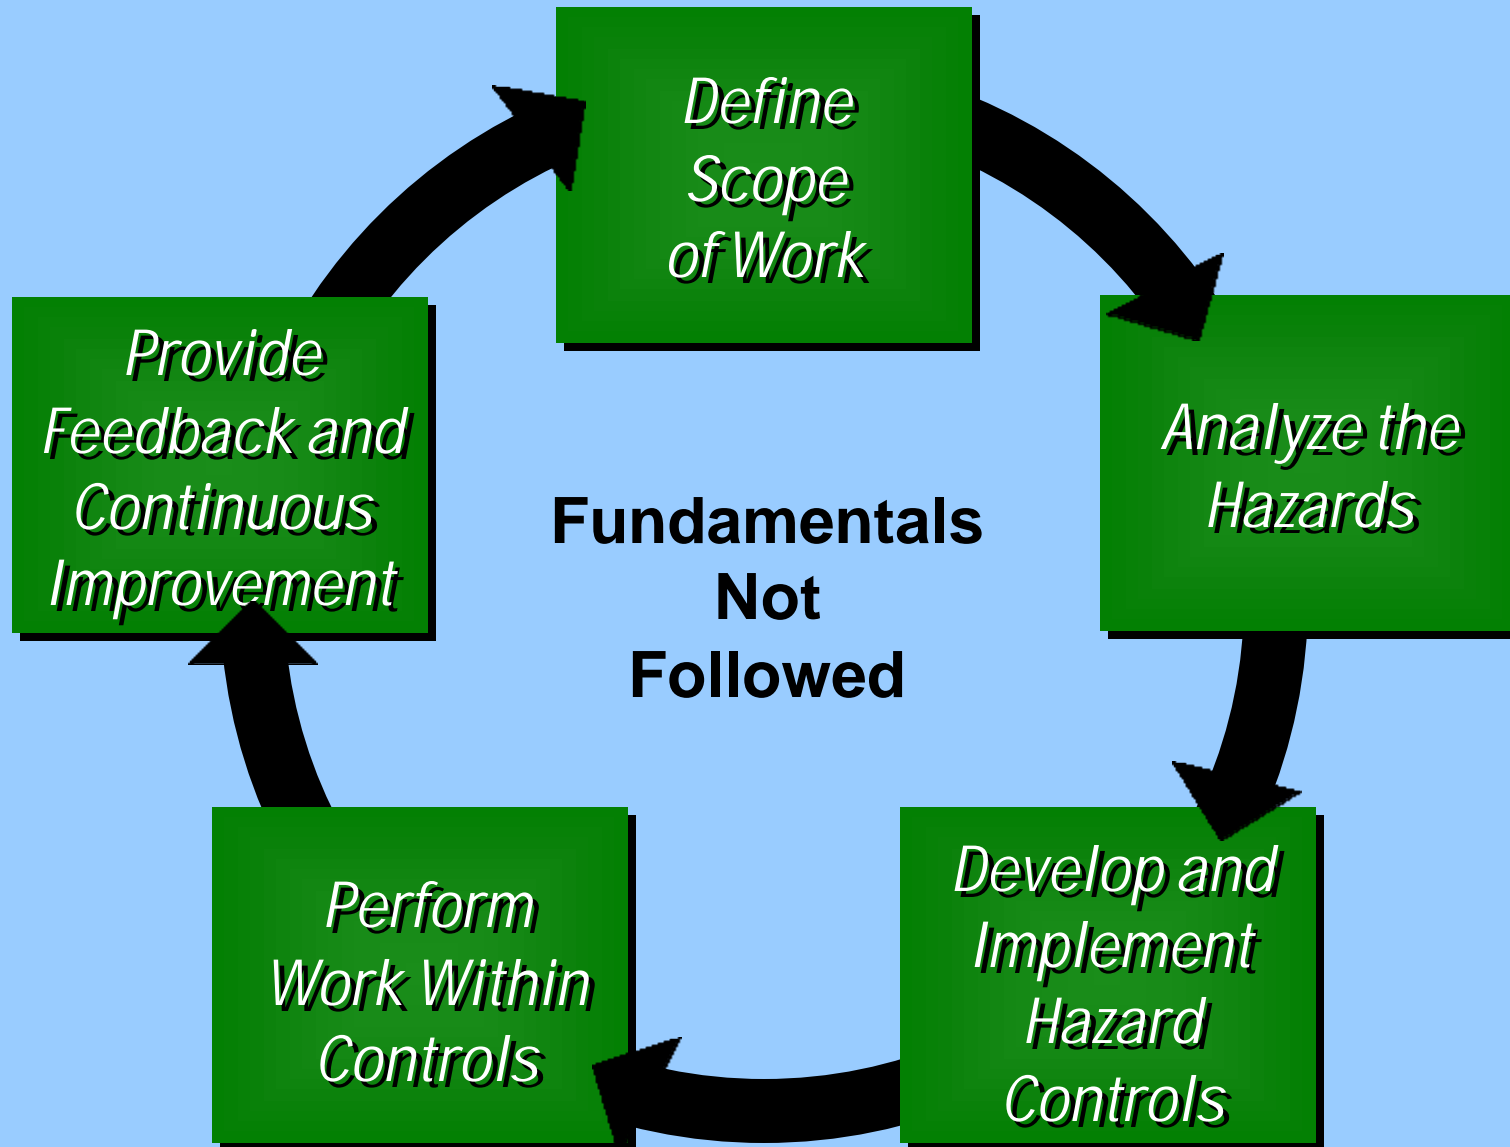

# Interior of Tank 241-Z-361

# Integrated Safety Management System

## Core Functions

# 1997 Secretarial Directives

## Scope

- ◆ Use, storage and disposal of chemicals
- ◆ Reassessment of known vulnerabilities, and evaluation for new ones on a continuing basis -- emphasis on waste storage tanks
- ◆ Technical competence to recognize full range of hazards
- ◆ Lessons Learned and Occurrence Reporting programs

# Highlights of Actions at Hanford

- ◆ Immediate risk reduction through walkdowns and disposal of unneeded chemicals
- ◆ Underground inactive tank declared a USQ
- ◆ DuPont assistance
- ◆ Sitewide chemical management system requirements developed jointly by all prime contractors
- ◆ Facility vulnerability assessments completed
- ◆ Weaknesses identified in lessons learned programs
- ◆ “Picric acid” incident (1/28/98) demonstrated improvements in emergency response and hazard awareness

# Challenge at Hanford

- ◆ **Major issue - sustaining a rigorous, sitewide effort to assess vulnerabilities and complete characterization and corrective actions**
  - ◆ Size of the problem
  - ◆ Technical issues
  - ◆ Competing priorities
  - ◆ Limited financial resources
- ◆ **Approach - formal process to ensure that appropriate attention and resources are applied**
  - ◆ Baseline change request and approval
  - ◆ Monthly reporting

# Facility Vulnerability Assessment

- ◆ Objectives, Scope, Methodology, Schedule
  - ◆ Focus on safety & health risks / corrective actions
  - ◆ All PHMC facilities, excluding those explicitly exempted
  - ◆ Scope of Vessels/materials/conditions defined
  - ◆ Comprehensive baseline on facility & vessel data
- ◆ Property & Waste Identification Data System Lists
- ◆ QA and documentation requirements
- ◆ Project Team and Major Subcontractor POCs
- ◆ Independent surveillance/validation

# Facility and Vessel Data

- ◆ Ownership & identification
- ◆ Facility condition & configuration control
- ◆ Characteristics/status of vessel and material
- ◆ Compatibility between material(s)/vessel
- ◆ Type of characterization data
- ◆ Need and schedule for further characterization
- ◆ Hazard ranking factors - likelihood & severity
- ◆ Relative rank and need for additional controls

## Score Distribution

# Two Groups of Vulnerabilities

## Activity-level (score<36):

- ♦ 1,157 items (88%) – good knowledge/controls
- ♦ Actions are part of work planning process
- ♦ First line supervisor responsible for resolving deficiencies

## ♦ Facility-level (score ≥ 36):

- ♦ 151 items (12%) – some knowledge/controls
- ♦ Actions typically require significant resources due to change in work-scope, priorities, safety basis/controls
- ♦ Actions recorded/tracked through Deficiency Tracking System and status reported to senior management

# Status Summary

- ◆ **Corrective actions managed through ISMS**
- ◆ **Container content data transfer to CMS**
- ◆ **Over 90% of corrective actions completed**
- ◆ **Remaining items being addressed by existing project efforts**
